FKBP46 is a novel insect cell nuclear immunophilin, which can be used to study and identify additional immunosuppressive drugs that bind to it. Such immunosuppressive agents can be used in treating transplant and tissue graft patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated immunophilin FKBP46 nucleic acids - useful for developing products for the study and identification of immunosuppressive agents for treating e.g. transplant and tissue graft patients

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL18176-ABL30511), expressed DNA sequences (ABL01840-ABL6175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a mouse Ice-4 protein sequence. The present sequence was used in a sequence homology comparison with the protein sequences of human Ice-ced 3 homolog (Ich-1) (AAB14253), murine interleukin-lbeta converting enzyme (mICE) (AAB14259), murine ICE2 (AAB14252) and C. elegans ced-3 (AAB14246). The coding sequence of the present sequence is a member of a family of genes involved in programmed cell death (apoptosis). Ich-1 may play an important role in both the positive and negative regulation of apoptosis. The Ich gene may be used in gene therapy in disorders characterised by cell death e.g. neural and in gene therapy in disorders characterised by cell death e.g. neural and muscular degenerative diseases, myocardial infarcation, stroke, virally

```
This sequence represents a cDNA encoding murine caspase-12L, a splice variant of caspase-12. Caspases are a family of proteins involved in the regulation of apoptosis and are synthesised as proforms which are activated via cleavage after specific Asp residues. Mammalian cells express several caspases, and it is thought that these act in a proteolytic cascade to cause programmed cell death. Nucleic acids encoding caspase-12s (AAZ3544) or truncated forms of caspase-12L (CAZ3546, AAZ3547) are used for production, recombinantly or in vivo, of caspase-12 polypeptides which induce programmed cell death. This is carticularly useful for treating (pre)mailgnant conditions (e.g., solid tumours, B cell lymphoma, chronic lymphocytic leukaemia, prostatic particularly useful for treating (pre)mailgnant conditions (e.g., solid tumours, B cell lymphoma, chronic lymphocytic leukaemia, prostatic particularly preneoplastic liver foci and resistance to chemotherapy), or autoimmune diseases. The caspase-12 proteins can also be used to raise specific antibodies (for example, to determine gene expression and to screen expression libraries) or as molecular weight markers. Fragments of caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used as probes to isolate the caspase-12 encoding nucleic acids can be used to raise encoding nucleic acids can be used to raise encoding nucleic acids can be used to raise encoding nucl

The present invention is concerned with methods for identifying compounds useful for modulating caspase-mediated apoptosis. These include the caspase-12 protein shown here. These agents can be used in the treatment
                                                                                                          Caspase-12 polypeptide useful for treating apoptotic conditions e.g. stroke, ischemia and proliferated disease e.g. cancer, lacks at least amino acids in a specific region of the native amino acid sequence -
                                                                          Claim 1; Page 65-66; 70pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a mouse Ice-4 protein sequence. The present sequence was used in a sequence homology comparison with the protein sequence of human Ice-ced 3 homolog (Ich-1) (AAB14253), murine interleukin-lbeta converting enzyme (mICE) (AAB14249), murine ICE2 (AAB14252) and C. elegans ced-3 (AAB14246). The coding sequence of the present sequence is a member of a family of genes involved in programmed cell death (apoptosis). Ich-1 may play an important role in both the positive and negative regulation of apoptosis. The Ich gene may be used in gene therapy in disorders characterised by cell death e.g. neural and muscular degenerative diseases, myocardial infarcation, stroke, virally

                                                                                  homolog (Ice-4), increasing Ice-4s enzymatic activity can promote the programmed cell death of cancer cells (pref those overexpressing the bcl-2 oncogene), this can be used as the basis of a new cancer treatment. Alternatively by reducing Ice-4s enzymatic activity programmed cell death can be inhibited, this may be useful in the development of new cell lines which remain viable in culture
                                                                                                                                                                                                                                              Promoting or preventing programmed cell death in vertebrate - by inhibiting the activity of interleukin-1 beta converti

                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG156-ABL30511), expressed DNA sequences (ABLIG159) and the encoded proteins (ABB737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes proteins and their fragments (I) encoded CC by chromosome 2 of the human malarial parasite, Plasmodium falciparum. CC Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). CC (I) and (II) are useful for the development of vaccines against CC (I) and (II) are useful for the development of vaccines against CC (I) and following the sequences of (I), are useful in the detection (I) and polyclonal antisera or a monoclonal CC consideration of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) CC can aid the identification of drugs to treat or prevent P. falciparum CC p. falciparum. Sequencing of the Plasmodium chromosome 2 and the consideration, or they can be used to identify drug resistance in CP falciparum. Sequencing of the Plasmodium chromosome 2 and the complexity of the parasite biology, a process hampered by the CC complexity of the parasite biology, a process hampered by the CC complexity of the parasite biology, a process hampered by the CC complexity of the parasite biology, a process hampered by the CC complexity of the parasite biology, a process hampered by the CC complexity of the parasite second of the control of the world, and there is a pressing need for vaccines and mosquito CC parts of the world, and there is a pressing need for vaccines and new CC drugs. AAA7078 to AAA70287 and ABBH144 to ABBH352 represent nucleotide CC and protein sequences given in the present invention, but which are not cc.
                                                                                                                                                                                                                                           AAB95086
                                                                                                                                                                                                                                                              RESULT 15

                                                                                                                                                                                                                                                                                                                                                                  The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set cc comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of cc the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc golynucleotide which comprises a 3'-end sequence complementary to a compount of the specification. The primer sets can be used in antisense therapy and comprise therapy. The primers are useful for synthesising polynucleotides, cc particularly full-length cDNAs. The primers are also useful for the company contains and contains an

Patent No. 6340740

GENERAL IMPORMATION:
APPLICANT: Alnemri, Emad S.
APPLICANT: Fernandez-Alnemri, Teresa
APPLICANT: Fernandez-Alnemri, Teresa
TITLE OF INVENTION: CASPASE-14, AN APOTOTIC PROTEASE, NUCLEIC ACID ENCODING
TITLE OF INVENTION: AND METHODS OF USE
TITLE FERENCE: 480140.434C1
CURRENT APPLICATION NUMBER: US/09/187,789
CURRENT FILING DATE: 1998-11-06
NUMBER OF SEQ ID NOS: 78
SOFTWARE: Patentin Ver. 2.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A, Molecule type: mRNA
A; Residues: 764-1001. 'APQ',1005-2036, 'VPSSVET' <0G2>
C; Superfamily: dynein heavy chain, ciliary
C; Keywords: ATP; heterotetramer; hydrolase; microtubule |
F; 154-161/Region: nucleotide-binding motif A (P-loop)
F; 1852-1859/Region: nucleotide-binding motif A (P-loop)
F; 2133-2140/Region: nucleotide-binding motif A (P-loop)
F; 2460-2467/Region: nucleotide-binding motif A (P-loop)
F; 2805-2812/Region: nucleotide-binding motif A (P-loop)
F; 160/Binding site: ATP (Lys) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nature 352, 643-645, 1991
A,Title: Four ATP-binding sites in the midregion of the beta heavy chain of dynein.
A,Reference number: S17231; MUID:91326104; PMID:1830928
A,Accession: S17231
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C;Species: Anthocidaris crassispina

J. Biol. Chem. 269:30828-30834 (1994).

I. FUNCTION: BINDS TO, AND IS INHIBITED BY FK506 AND RAPAMYCIN. BIND DOUBLE-STRANDED DNA IN VITRO. PPLASES ACCELERATE PROTEIN FOLDING.

I. CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.

I. SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DOMAIN
